Cheavy chain, designated HmuH. HmuH is based on the heavy Chain (see
CAAW71888) of murine anti-human Fas monoclonal antibody CH11. The
Chumanised sequence was designed following selection of donor residues
CC from CH11 to be grafted onto acceptor molecule 21.28 (CL. 2 Heavy chain
CC sequences (see AAW71880-81) have been designed, and each can be used in
CC combination with any of 4 light chain sequences (see AAW71876-79) to
CC provide novel, claimed humanised CH11 IgM antibodies that lack a J chain.
CC apoptosis in cells expressing Fas antibodies are capable of inducing
CC apoptosis in cells expressing Fas (e.g. synoviceytes) and are useful in
CC the treatment of autoimmune disease and chronic rheumaned, as are vectors
CC sequences encoding the humanised antibodies are claimed, as are vectors
CC such as pHmuH5-1 including the HmuH nucleotide sequence (see AAV61363),
CC and host cells such as Escherichia coli pHWuH5-1 (FERM BP-5863)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     र्
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to antirheumatic agents which comprise as cative ingredients an immunoglobulin M (IgM) protein. The IgM protein CC does not include a J segment, has apoptosis inducing activity, and CC consists of a light and heavy chain polypeptide produced synthetically. CC The agents of the invention exhibit antirheumatic and immunosuppressive cc activity and can be used to treat autoimmune diseases, especially CC rheumatism. The IgM molecule used in the invention has human Fas-antigen CC the IgM light and heavy chains (see AAA78267-A78272) and the CC corresponding protein sequences (see AAA78267-A78272) and the CC corresponding protein sequences (see AAB12913-B12918 and AAB12919), and CC corresponding protein sequences (see AAB12913-B12918 and AAB12919), and CC corresponding protein sequences (see AAB12918 and AAB12919), and CC chains used in the invention are represented by sequences (see AAB12918-B12910). Also CC corresponding the invention are represented by sequences AAA78213-CC A78266. Primers used for sequencing the human Ig DNA used in the CC invention are represented by sequences AAA78277-A78318 and AAA78335-CC A78337, while humanised anti-Fas Ig DNA sequencing primers are CC represented by sequences AAA78212 are specific for murine Ig DNA, and are used in the production of the agent of the invention

The invention is useful for inhibiting spread of lung cancer, and effectively controls the spread of lung cancer. The present sequence represents a CDR transplant antibody heavy chain variable region.
                                                                                                     Gene recombinant antibodies, useful for diagnosis and as remedies diseases due to abnormal neovascularization e.g. proliferation or metastasis of solid tumor, rheumatoid arthritis, diabetic retinopa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antibody; human; vascular endothelial growth factor; VEGF receptor; Flt-1; neovascularisation; cell proliferation; metastasis; tumour; rheumatoid arthritis; retinopathy; psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Preventive or therapeutic agent of lung selective cancer metastasis containing the substance which inhibits the information transmission which intervenes human VEGF receptor Flt-1 as an active ingredient.

CC This invention relates to a reagent for detecting differentiation of C monocytes and macrophages from haematopoietic stem cells, containing a CC substance which binds to human vascular endothelial growth factor (VEGF) CC receptor Flt-1. The invention also includes a method for diagnosing a CC disease in which the differentiation of monocytes and macrophages is CC implicated, using the method, containing a substance which binds to Flt-1 CC or a substance which inhibits the signal transduction of Flt-1. Diseases CC diagnosed using the method, containing a substance which binds to Flt-1 CC or a substance which inhibits the signal transduction of Flt-1 Diseases CC diagnosed or treated include inflammation, delayed CC hypersensitivity, malignant tumours and arteriosclerosis. AAF70190 - CC AAF70244, AAF70251 and AAF70258 represent DNA sequences encoding anti-CC the construction of the antibody fragments, and oligonucleotides used in the construction of the antibody fragments, and signal antibody is used in the construction of the invention. PCR primers AAF70245 - AAF78870 (excluding CC AAF70251) are used in the isolation of the antibody DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Substances binding to human vascular endothelial growth factor receptor Flt-1, used for diagnosis and treatment of inflammatory diseases, arteriosclerosis, cancer and delayed hypersensitivity.

The antibodies are useful for diagnosts and as remedies for diseases due to abnormal neovascularisation such as proliferation or metastasis of solid tumor, arthritis in rheumatoid arthritis, diabetic retinopathy, premature retinopathy and psoriasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (КУОМ ) КУОМА НАККО КОБУО КК

                                       antibody (MAb) D12 heavy chain variable region of the murine monoclonal humanised D12 VH (see also AAW84097). A synthetic gene (see AAV81901) encoding the protein was prepared from synthetic oligonucleotides and used to prepare an expression vector for humanised D12 VH. D12 is an anti-human alpha-v beta-3 vitronectin receptor MAb. Humanised D12 MAbs can be used for passive immunotherapy of disorders mediated by the alpha-v beta-3 vitronectin receptor, e.g. restenosis and angiogenic associated diseases
                                                                                                                                                                                                                                                                                                                                                   New anti alpha v beta_3 vitronectin receptor antibodies - used for immunotherapeutic treatment of e.g. diabetic retinopathy, inflammatory disorders, atherosclerosis, restenosis, cancers or osteoporosis.
                                                                                                                                                                                                                                                                                                                    Example 13;

The sequences given in AAR29016-17 are portions of monoclonal antibodies which were encoded by plasmids contained within the mouse hybridoma, AUK12-20. The DNA encoding the complementarity determining regions (CDR's) was isolated by polymerase chain reaction. These antibodies recognise human interleukin-6 receptor (II-6R). The hybridoma cells were transformed with plasmids containing fragments of the antibody gene which

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This polypeptide comprises version 'b', of a reshaped human antibody AUX12-20 VH region. A DNA fragment encoding the polypeptide was subcloned into vector pUC19 for use as a template for PCR amplification and production of version 'a' of a reshaped human 21.6 VH region (see AAW22413) that can be used in the construction of novel humanised antibalpha-4 integrin antibodies. Claimed humanised antibodies are useful in the treatment of asthma, atherosclerosis, AIDS, dementia, diabetes, inflammatory bowel disease, rheumatoid arthritis, transplant rejection, graft versus host disease, tumour metastasis, nephritis, atopic dermatitis, psoriasis, myocardial ischaemia, and acute leukocyte mediated
                                                                                                                                                                                                                                                                                                           Synthetic.

                                                                                                                                                                                                                                                                                                                                                  22-JAN-1999
                                                                                                                                                                                                                                                                                                                                                                         AAW73187;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAR29016-17 are portions of monoclonal antibo which were encoded by plasmids contained within the mouse hybridoma, AUKI2-20. The DNA encoding the complementarity determining regions (CDR's) was isolated by polymerase chain reaction. These antibodies recognise human interleukin-6 receptor (II-6R). The hybridoma cells transformed with plasmids containing fragments of the antibody gene caused the production of the antibody from the hybridoma cell line. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                  Sequence 117
                                                                                                                                                                                                                                                                                   The present invention relates to a preventive or therapeutic agent of lung selective cancer metastasis containing the substance which inhibits the information transmission which intervenes human vascular endothelial growth factor (VEGF) receptor Flt-1 as an active ingredient. The invention is useful for inhibiting spread of lung cancer, and effectively controls the spread of lung cancer. The present sequence represents a CDI transplant antibody heavy chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Preventive or therapeutic agent of lung selective cancer metastasis containing the substance which inhibits the information transmission which intervenes human VEGF receptor Flt-1 as an active ingredient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       JP2003261460-A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cancer metastasis; human vas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      encoding the antibody, and vectors and transformants containing it, can be used for the recombinant production of the antibody. The antibody itself can be used as an anti-tumour agent or as a diagnostic tool for related cancers. The antibody has antitumour activity against ganglioside GM2 positive cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      08-MAR-2002; 2002JP-00063835
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   16-SEP-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a gene recombinant antibody that has specification with human vascular endothelial growth factor (VEGF) receptor Pit-1. The antibodies are useful for adjacency remedies for diseases due to abnormal neovascularisation such as proliferation or metastasis of solid tumor, arthritis in rheumatoid arthritis, diabetication pathy, premature retinopathy and psoriasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gene recombinant antibodies, useful for diagnosis and as remedies for diseases due to abnormal neovascularization e.g. proliferation or metastasis of solid tumor, rheumatoid arthritis, diabetic retinopathy

The present sequence represents the heavy chain variable region of the Chumanised murine antibody 3D1. The antibody has a binding specificity to B7 molecules. The antibody is used to construct humanized cimmunoglobulins, which comprise an antigen binding region of non-human corigin and a portion of a human immunoglobulin. The humanized cimmunoglobulins are useful for treating autoimmune diseases, infectious continuoglobulins are useful for treating autoimmune diseases, diabetes confilment inflammatory disorders, systemic lupus erythematosus, diabetes confilment inflammatory bowel disease, arthritis, inflammatory bowel disease, confilment or preventing transplant recipient or preventing transplant recipient, and treating proliferative disease (leukemia, lymphoma and cancer), anaemia (sixkle-cell anaemia, confilment congenital immunodeficiency diseases, and myeloid dysplasia syndrome

Functional antibodies modified to increase or decrease stability - have specific amino acid substns. in the variable domain, determined by reference to consensus sequences. consensus sequences.

Claim 2; Page 35; 43pp; German.

Consensus sequences were established for antibody variable regions from human and mouse heavy and light (kappa and lambda) chains. In addition, frequency tables listing the amino acids which can be found at each position were compiled. In a new method, mutations are introduced into an antibody variable domain by reference to the frequency table. When an amino acid is replaced by one which occurs at a higher frequency at that position, the resulting antibody chain is more stable than the wild-type; when an amino acid is replaced by one which occurs less frequently (or not at all), the resulting antibody is less stable than the wild-type. Stablised antibodies are useful as diagnostic reagents, as catalysts and stablised antibodies are useful as diagnostic reagents, as catalysts and in treatment of cancer, autoimmune diseases and infections. Destabilised

The 130 bp HindIII-Peti fragment of pRAS111 (AAQ64806) was used to replace the corresponding fragment of pRAS111 (AAQ64807), to generate pRAS118. This generates a NIP-reactive ScFv (NIP = 4-hydroxyl-3-iodo-5-nitrophylacetic acid) with a BglII cloning site immediately downstream of the pelB leader, suitable for inserting fragments of Ad5 fibre. The invention is concerned with the fusion of an ScFv with the Ad5 fibre withat the fusion sequence can be used to target cells for gene therapy. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                     The sequence is used in the prodn. of a chimeric antibody mol. comprising two light chains and two heavy chains, each having a constant region (human) and a variable region (murine) having specificity to an antigen bound by murine monoclonal antibody (MAb) Br-3. The chimeric antibodies can be used for any purpose for which the original murine MAbs can be used, with the advantage that they are more compatible with the human body. They are esp. used for the diagnosis and treatment of cancer. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                                                         The light chain variable region (AAW06211) of mouse monoclonal antibody Br-3 is the product of a cDNA clone (AAT43436) isolated from a Br-3 hybridoma cDNA library. AMB Br-3 (IgG1) binds to an antigen that is expressed on the surface of human lung, breast, colon and ovary carcinomas, but not on most normal adult tissues. The light chain and heavy chain variable regions (see also AAW06212) of B38-1 can be linked to human constant regions and expressed in transformed host cells. Novel mouse-human chimeric antibodies (see also AAW06212) of AAW06213-18) can be produced that have specificity to human tumour antigens and can be used for the treatment and diagnosis of human cancer.                                                                                                                                                                            The present sequence represents the heavy chain variable region of murine antibody Br-3. The sequence was used to create chimeric mouse-human immunoglobulins which recognise the human tumour antigen bound by antibody ING-1 (produced by hybridoma cell line ATCC HB 9812). The chimeric antibodies also have an antigen-binding site that competitively inhibits the binding of antibody ING-1, and mediate complement-dependent cytolysis of target cells or antibody-dependent cellular cytotoxicity to target cells. The chimeric antibodies can be used for therapeutic purposes in the treatment of human cancer. (Updated on 20-MAR-2003 to

The invention describes an antibody comprising a human constant region CC and a variable region having specificity for the human tumour antigen CC bound by the ING-1 antibody, where the ING-1 is produced by cell line CC HB9812 as deposited with ATCC, and the antibody has the same affinity as the ING-1 for the human tumour antigen. The antibody is useful in an CC immunoassay method for detecting an antigen in a sample by contacting the CC label-detectable antigen in the sample with the antibody, detecting the CC antigen in an animal by contacting the antigen; for CC use in an imaging method for revealing the presence of a label-detectable and relating the antigen, detecting the label and relating the gresence of the antigen; for CC detected label to the presence of the antigen; and for killing cells carrying an antigen by contacting the antibody with a part of the animal CC allowing the killing to occur. The antibodies are useful in tumour CC diagnosis and therapy. The chimeric antibodies bind to the surface of human tumour cells but do not bind detectably to normal cells, e.g., CC fibroblasts, endothelial cells or epithelial cells in the major organs. CC the high biological activity of the chimeric antibodies against human cclls but do not bind detectivity with normal tissues comply that these antibodies may mediate selective destruction of CC malignant tissue. The presence of human rather than murine antigenic cells contacting the chimeric antibodies increases their resistance to clearance chimeric antibodies increases their resistance to clearance enhances the potential utility of these chimeric antibodies. This is the amino acid sequence of a mouse antibody light chain crianially and the creation of an anti-human tumour antigen-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antibody for detecting antigen in animal or killing cells carrying antigen comprises human constant region and variable region having specificity for human tumor antigen bound by ING-1 antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 3; Fig 14; 101pp; English.

                                                                                                                                                            The invention relates to a novel canine heavy or light chain variable domain polypeptide. The protein of the invention demonstrates antiallergic activity and may be used for treating canine allergy, possibly via gene therapy. The current sequence is that of a murine immunoglobulin light chain variable domain protein of the invention.

AAR95946-R95948 represent CC sequences for variable regions of an antibody produced by the hybridoma cell line HNK-20. HNK-20 and 3G3 are murine hybridoma cell lines, that CC virus (RSV). The DNA encoding these sequences were isolated using primers CC specific for the 5' untranslated region of the variable region, and for CC primer sequences). The DNA encoding these sequences can be inserted into CC primer sequences). The DNA encoding these sequences can be inserted into CC primer sequences). The DNA encoding these sequences can be inserted into CC primer sequences). The DNA encoding these sequences can be inserted into CC primer sequences. The DNA encoding these sequences can be inserted into CC primer sequences and broading these sequences can be inserted into CC primer sequences. The DNA encoding these sequences can be inserted into CC expression of chimeric and isotype-switched antibodies. The CC such as pneumonia and bronchiolitis, in humans and animals. By using the producting fragments that have to be adapted for recombinant antibody cexpression. Also, by using the genomic DNA, no knowledge of the DNA CC sequence encoding the target variable region is required. Chimeric CC of the host being treated, are less likely to cause adverse immune
                                                                                                                                                                                                                 Query Match

The crystals comprise at least an epitope binding fragment of the SM3 antibody bound to a peptide recognised by the epitope binding site of SM3. The products and methods can be used to develop agents for the detection of tumour cells and for therapy against tumours. MUC1 epitope mimics can also be used to prevent or decrease an immune response, e.g. in the therapy of diseases caused by autoimmune response, inflammatory disorders or transplant rejections such as graft versus host disease. The present sequence represents the amino acid sequence of a light chain variable region of SM3 antibody
                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                             The invention relates to a process for preparing a crystal using cadmium structure factors or structural coordinates obtained from the crystal of
                                                                                                                                                                                                                                                                                                                                                                                                                                       New SM3 antibody crystal structures - used to e.g. tumors, autoimmune disorders, allergies, transplant rejection.

                                                                                                                                                                                                                                                                                                  cytostatic, immunostimulatory, antileukaemia and antiproliferative activities. These compounds can be used for diagnosing, preventing and treating malignant cell growth related to malignancies of haematopoietic cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas, melanomas and sarcomas. The present sequence is a murine anti-Lewis Y antibody single-chain FV (scFV) fragment which is used in the construction of heterominibodies comprising CH1 (first constant domain of human 1gG1 heavy chain), CK (constant region of human Ig-kappa light chain) and CD80 molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The patent discloses heterominibodies which are multifunctional compounds produceable in a mammalian host cell as a secretable and fully functional heterodimer of two polypeptide chains, where one of the polypeptide chains comprises, a CHI-domain (constant domain of an immunoglobulin heavy chain) and the other chain comprises CL-domain (constant domain of an immunoglobulin light chain). The polypeptide chains further comprise, fused to the constant domains at least two (poly)peptides having different receptor or ligand functions, where further at least two of the different (poly)peptides lack an intrinsic affinity for one another and are linked via the constant domains. The heterominibodies have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Murine; Lewis Y; LeY; antibody; single-chain Fv fragment; scFv; heterominibody; multifunctional compound; CH1-domain; CL-domain; heavy chain; constant domain; light chain; CD80 molecule; immunoglobulin; cytostatic; immunostimulatory; antileukaemia; diagnosis; antiproliferative; prevention; treatment; malignant; haematopoietic cell; lymphoma; leukaemia; solid tumour; carcinoma; melanoma; sarcoma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel canine heavy or light chain variable domain polypeptide. The protein of the invention demonstrates antiallergic activity and may be useful for treating canine allergy, possibly via gene therapy. The current sequence is that of a murine immunoglobulin light chain variable domain protein of the invention.
New canine heavy and light chain variable treating canine allergy.

The protein of the invention demonstrates antiallergic activity and may be useful for treating canine allergy, possibly via gene therapy. The current sequence is that of a murine immunoglobulin light chain variable domain protein of the invention.

RI Proc. Natl. Acad. Sci. U.S.A. 70:2112-2116(1973).
CC -1- MISCELLANEOUS: Compositions and partial sequences of RPC 20 show CC no differences from MOPC 104E. The sequences of J558 and S104
CC -1- MISCELLANEOUS: These proteins were isolated from serum or urine of tumor-bearing mice.
CC -1- MISCELLANEOUS: The MOPC 104E precursor was synthesized in a cell-cree system directed by mRNA isolated from MOPC 104E myeloma CC polysomes. Met-1 was lacking in 90% of the chains. It is probably Cc rapidly cleaved after synthesis.
CC -1- SIMILARITY: Contains 1 immunoglobulin-like domain.
